

PALLET RACK TEAR DROP BOLTED UPRIGHT FRAME CAPACITY

The pallet rack upright frame weight capacity is determined by the height between levels. The higher the height between levels, the less the pallet rack upright capacity will be.

To determine the height between levels, measure the distance between the storage levels. Maximum unsupported length is the maximum beam spacing or the distance between the floor and the top of the first beam (whichever is greater).

Please view the upright frame capacity chart below to determine if your application preferences meet the requirements for this upright frame model:

Interlake Mecalux – Bolted Upright Frame Capacity

Height Between Levels	Capacity
36"	24,571 lbs
42"	22,807 lbs
48"	20,867 lbs
54"	18,849 lbs
60"	16,849 lbs
66"	14,784 lbs
72"	12,982 lbs
78"	11,156 lbs
