

Locate Active Tunnels

Selecting the proper area to place the Poison Moleworms™ is essential to successfully getting rid of moles in your yard. Begin by locating active tunnels. Make one-inch holes in the roof of a tunnel and mark the openings with the locator flags included in the Poison Moleworm™ package. Revisit the holes after 24-48 hours. Tunnels that have had holes resealed are an indicator of mole activity and a good place to bait.

Proper Bait Placement

After you've located an active tunnel, simply poke a hole that's slightly larger than the diameter of the Poison Moleworm™ in the roof of the active tunnel and drop the mole killer in. Reseal with dirt and repeat every 5 to 10 feet.
